Abstract—

Index Terms—

I. Introduction

II. System Model

A. Graph Model

C is set of cloud nodes. F is set of fog nodes. E is set of edge nodes. S is set of sensor nodes. R is set of resources in each computational node(cloud, fog or edge node).

$$C = \{v_1^c, v_2^c, ..., v_{|C|}^c\}, c \in C \tag{1a}$$
$$F = \{v_1^f, v_2^f, ..., v_{|F|}^f\}, f \in F \tag{1b}$$
$$E = \{v_1^e, v_2^e, ..., v_{|E|}^e\}, e \in E \tag{1c}$$
$$S = \{v_1^s, v_2^s, ..., v_{|S|}^s\}, s \in S \tag{1d}$$
$$R = \{CPU, RAM, Storage\}, r \in R \tag{1e}$$

σ_c^r is total capacity of resource $r \in R$ on node $c \in C$. and also σ_f^r and σ_e^r are total capcity of resource $r \in R$ on nodes $f \in F$ and $e \in E$ respectively.

T is set of tasks.

$$T = \{t_1, t_2, ..., t_{|T|}\} \tag{2a}$$

Each task expresses as follows:

$$t \in T => t = (w_t, \delta_t, N_t, f_t^r(\lambda_t)) \tag{3}$$

w_t shows computation workload of the task. δ_t is completion deadline of the task and N_t determines the maximum number of instaces of task $t \in T$.

π_c is unit price of processing in node $c \in C$ and also π_f and π_e are the ralated prices in nodes $f \in F$ and $e \in E$ respectively.

Transmition delays that show required time for trasmiting packets from sensors to each computational node are defined as follows:

$\tau_{s,c}^{tr}$ = trasmition delay between node $s \in S$ and $c \in C$
$\tau_{s,f}^{tr}$ = trasmition delay between node $s \in S$ and $f \in F$
$\tau_{s,e}^{tr}$ = trasmition delay between node $s \in S$ and $e \in E$

B. Variables

We define three integer variables for allocating tasks between nodes.

$$x_{t,c} = \begin{cases} 1 & \text{task } t \in T \text{ is allocated to node } c \in C \\ 0 & \text{o.w.} \end{cases} \tag{4a}$$

$$x_{t,f} = \begin{cases} 1 & \text{task } t \in T \text{ is allocated to node } f \in F \\ 0 & \text{o.w.} \end{cases} \tag{4b}$$

$$x_{t,e} = \begin{cases} 1 & \text{task } t \in T \text{ is allocated to node } e \in E \\ 0 & \text{o.w.} \end{cases} \tag{4c}$$

there are two continouse variables:

$$\lambda_{t,s} = \text{poisson rate of task } t \in T \text{ generated by node } s \in S \tag{5a}$$

$$0 \le \beta_{t,s,c} \le \lambda_{t,s} \quad \forall t \in T, \forall s \in S, \forall c \in C \tag{5b}$$
$$0 \le \beta_{t,s,f} \le \lambda_{t,s} \quad \forall t \in T, \forall s \in S, \forall f \in F \tag{5c}$$
$$0 \le \beta_{t,s,e} \le \lambda_{t,s} \quad \forall t \in T, \forall s \in S, \forall e \in E \tag{5d}$$

$$\beta_{t,s,c} = \text{size of flow of task } t \in T \text{ from node } s \in S \text{ to node } c \in C \tag{5e}$$

C. Constraints

$$\lambda_{t,c} = \sum_{s \in S} \beta_{t,s,c} \quad \forall t \in T, \forall c \in C \tag{6a}$$
$$\lambda_{t,f} = \sum_{s \in S} \beta_{t,s,f} \quad \forall t \in T, \forall f \in F \tag{6b}$$
$$\lambda_{t,e} = \sum_{s \in S} \beta_{t,s,e} \quad \forall t \in T, \forall e \in E \tag{6c}$$

$$\frac{\lambda_{t,c}}{\sum_{s \in S} \lambda_{t,s}} \le x_{t,c} \quad \forall t \in T, \forall c \in C \tag{7a}$$
$$\frac{\lambda_{t,f}}{\sum_{s \in S} \lambda_{t,s}} \le x_{t,f} \quad \forall t \in T, \forall f \in F \tag{7b}$$
$$\frac{\lambda_{t,e}}{\sum_{s \in S} \lambda_{t,s}} \le x_{t,e} \quad \forall t \in T, \forall e \in E \tag{7c}$$

$$\lambda_{t,s} = \sum_{e\in E}\beta_{t,s,e} + \sum_{f\in F}\beta_{t,s,f} + \sum_{c\in C}\beta_{t,s,c} \quad \forall t\in T, \forall s\in S \tag{8a}$$

$$\lambda_{t,s} \le \sum_{e\in E}\beta_{t,s,e} + \sum_{f\in F}\beta_{t,s,f} + \sum_{c\in C}\beta_{t,s,c} \le \lambda_{t,s} + \epsilon \quad \forall t\in T, \forall s\in S \tag{8b}$$

$$\sum_{t\in T} x_{t,c} f_t^r(\lambda_{t,c}) \le \sigma_c^r \quad \forall r\in R, \forall c\in C \tag{9a}$$
$$x_{t,c} f_t^r(\lambda_{t,c}) = k_1^r x_{t,c}\lambda_{t,c} + k_2^r x_{t,c} \tag{9b}$$
$$\psi_{t,c} \triangleq x_{t,c}\lambda_{t,c} \Rightarrow 0 \le \psi_{t,c} \le \lambda_{t,c} \tag{9c}$$
$$Q(x_{t,c}-1) + \lambda_{t,c} \le \psi_{t,c} \le x_{t,c}Q \tag{9d}$$
$$\begin{aligned} Q &= \max_{t\in T, c\in C}\lambda_{t,c} \\ &= \max_{t\in T, c\in C}\sum_{s\in S}\beta_{t,s,c} \\ &= \sum_{s\in S}\max_{t\in T, c\in C}\beta_{t,s,c} \\ &= \sum_{s\in S}\lambda_{t,s} \end{aligned} \tag{9e}$$

$$0 \le \psi_{t,c} \le \lambda_{t,c} \tag{10a}$$
$$Q(x_{t,c}-1) + \lambda_{t,c} \le \psi_{t,c} \le x_{t,c}Q \quad \forall t\in T, \forall c\in C \tag{10b}$$
$$0 \le \psi_{t,f} \le \lambda_{t,f} \tag{10c}$$
$$Q(x_{t,f}-1) + \lambda_{t,f} \le \psi_{t,f} \le x_{t,f}Q \quad \forall t\in T, \forall f\in F \tag{10d}$$
$$0 \le \psi_{t,e} \le \lambda_{t,e} \tag{10e}$$
$$Q(x_{t,e}-1) + \lambda_{t,e} \le \psi_{t,e} \le x_{t,e}Q \quad \forall t\in T, \forall e\in E \tag{10f}$$

$$\sum_{t\in T} k_1^r\psi_{t,c} + k_2^r x_{t,c} \le \sigma_c^r \quad \forall r\in R, \forall c\in C \tag{11a}$$
$$\sum_{t\in T} k_1^r\psi_{t,f} + k_2^r x_{t,f} \le \sigma_f^r \quad \forall r\in R, \forall f\in F \tag{11b}$$
$$\sum_{t\in T} k_1^r\psi_{t,e} + k_2^r x_{t,e} \le \sigma_e^r \quad \forall r\in R, \forall e\in E \tag{11c}$$

$$\tau_{t,c} = \tau_{t,s,c}^{tr} + \frac{1}{\mu_{t,c} - \lambda_{t,c}} \tag{12a}$$

We have:

$$\frac{1}{\mu_{t,c}} = \frac{w_t}{f_t^{cpu}(\lambda_{t,c})} \tag{12b}$$
$$f_t^{cpu}(\lambda_{t,c}) = k_1^{cpu}\lambda_{t,c} + k_2^{cpu} \tag{12c}$$
$$\begin{aligned} &\Rightarrow x_{t,c}\tau_{t,c} = x_{t,c}(\tau_{t,s,c}^{tr} + \frac{w_t}{(k_1^{cpu} - w_t)\lambda_{t,c} + k_2^{cpu}}) \\ &\le \delta_t \quad \forall t\in T, \forall s\in S, \forall c\in C \end{aligned} \tag{12d}$$

$$\begin{aligned} &x_{t,c}\lambda_{t,c}(k_1^{cpu} - w_t)\tau_{t,s,c}^{tr} + \\ &x_{t,c}k_2^{cpu}\tau_{t,s,c}^{tr} + w_t x_{t,c} - k_2^{cpu}\delta_t \\ &-(k_1^{cpu} - w_t)\delta_t\lambda_{t,c} \le 0 \quad \forall t\in T, \forall s\in S, \forall c\in C \end{aligned} \tag{12e}$$

$$\begin{aligned} &\psi_{t,s,c}(k_1^{cpu} - w_t)\tau_{t,s,c}^{tr} + \\ &x_{t,c}k_2^{cpu}\tau_{t,s,c}^{tr} + w_t x_{t,c} - k_2^{cpu}\delta_t \\ &-(k_1^{cpu} - w_t)\delta_t\lambda_{t,c} \le 0 \end{aligned} \tag{13a}$$

$$\begin{aligned} &\psi_{t,s,f}(k_1^{cpu} - w_t)\tau_{t,s,f}^{tr} + \\ &x_{t,f}k_2^{cpu}\tau_{t,s,f}^{tr} + w_t x_{t,f} - k_2^{cpu}\delta_t \\ &-(k_1^{cpu} - w_t)\delta_t\lambda_{t,f} \le 0 \end{aligned} \tag{13b}$$

$$\begin{aligned} &\psi_{t,s,e}(k_1^{cpu} - w_t)\tau_{t,s,e}^{tr} + \\ &x_{t,e}k_2^{cpu}\tau_{t,s,e}^{tr} + w_t x_{t,e} - k_2^{cpu}\delta_t \\ &-(k_1^{cpu} - w_t)\delta_t\lambda_{t,e} \le 0 \end{aligned} \tag{13c}$$

$$1 \le \sum_{e\in E} x_{t,e} + \sum_{f\in F} x_{t,f} + \sum_{c\in C} x_{t,c} \le N_t \quad \forall t\in T \tag{14a}$$

$$x_{t,c}(\lambda_{t,c} < \mu_{t,c}) => x_{t,c}(\lambda_{t,c} + \epsilon \le \mu_{t,c}) \tag{15a}$$
$$x_{t,c}\lambda_{t,c} = \lambda_{t,c} \tag{15b}$$
$$=> \epsilon x_{t,c} - k_1^{cpu}\lambda_{t,c} - k_2^{cpu} + w_t\lambda_{t,c} \le 0 \quad \forall t\in T, \forall c\in C \tag{15c}$$
$$\epsilon x_{t,f} - k_1^{cpu}\lambda_{t,f} - k_2^{cpu} + w_t\lambda_{t,f} \le 0 \quad \forall t\in T, \forall f\in F \tag{15d}$$
$$\epsilon x_{t,e} - k_1^{cpu}\lambda_{t,e} - k_2^{cpu} + w_t\lambda_{t,e} \le 0 \quad \forall t\in T, \forall e\in E \tag{15e}$$

$$\begin{aligned} &\min \sum_{t\in T}\sum_{e\in E}(x_{t,e}\pi_e\sum_{r\in R} f_t^r(\lambda_{t,e})) \\ &+ \sum_{t\in T}\sum_{f\in F}(x_{t,f}\pi_f\sum_{r\in R} f_t^r(\lambda_{t,f})) \\ &+ \sum_{t\in T}\sum_{c\in C}(x_{t,c}\pi_c\sum_{r\in R} f_t^r(\lambda_{t,c})) \end{aligned} \tag{16a}$$

&+ \sum_{j=1}^{l_f} x_{k,j}^f C(v_j^f, t_k)\\
&+ \sum_{h=1}^{l_c} x_{k,h}^c C(v_h^c, t_k)
\end{aligned} \tag{23a}
$$

$$
\min \sum_{k=1}^{l_t} p_k \tag{24a}
$$

subject to: 9

E. Solution

We can reshape main problem as following:

$$\min(\sum_{i=1}^{l_e}\sum_{k=1}^{l_t} x^e_{k,i}C^e_{k,i} \tag{25a}$$
$$+\sum_{j=1}^{l_f}\sum_{k=1}^{l_t} x^f_{k,j}C^f_{k,j}+\sum_{h=1}^{l_c}\sum_{k=1}^{l_t} x^c_{k,h}C^c_{k,h})$$

subject to:

$$\sum_{i=1}^{l_e} x^e_{k,i}\tau^e_{k,i}+\sum_{j=1}^{l_f} x^f_{k,j}\tau^f_{k,j}+\sum_{h=1}^{l_c} x^c_{k,h}\tau^c_{k,h}\le\delta_k \quad \forall k\in\{1,...,l_t\}$$
$$\sum_{k=1}^{l_t} x^c_{k,h}w_k\le c^c_h \qquad \forall h\in\{1,2,...,l_c\}$$
$$\sum_{k=1}^{l_t} x^f_{k,j}w_k\le c^f_j \qquad \forall j\in\{1,2,...,l_f\}$$
$$\sum_{k=1}^{l_t} x^e_{k,i}w_k\le c^e_i \qquad \forall i\in\{1,2,...,l_e\}$$
$$\sum_{i=1}^{l_e} x^e_{k,i}+\sum_{j=1}^{l_f} x^f_{k,j}+\sum_{h=1}^{l_c} x^c_{k,h}=1 \qquad \forall k\in\{1,2,...,l_t\}$$

We define u^m for each computational agent m, that is a matrix with size $l_t*(l_e+l_f+l_c)$. It is the local copy of all variables in agent m. i.e. $u^{e,m}_{k,i}$ is the copy of variable $x^e_{k,i}$ in agent m for $m=1,..,(l_m=l_e+l_f+l_c)$. So we should add new constraint $u^m=z \quad \forall m$ to main problem. We will use admm on this new constraint so:

$$L_p=\sum_{i=1}^{l_e}\sum_{k=1}^{l_t} x^e_{k,i}C^e_{k,i}+\sum_{j=1}^{l_f}\sum_{k=1}^{l_t} x^f_{k,j}C^f_{k,j}+\sum_{h=1}^{l_c}\sum_{k=1}^{l_t} x^c_{k,h}C^c_{k,h} \tag{26a}$$
$$+\sum_{m=1}^{l_m}\nu^m*(u^m-z)+\sum_{m=1}^{l_m}\frac{\rho}{2}\|u^m-z\|^2$$

We can seperate augmented lagrangian for each computational agent m then:

$$L^m_p=\sum_{k=1}^{l_t} u^m_{k,m}C_{k,m}+\nu^m*(u^m-z)+\frac{\rho}{2}\|u^m-z\|^2 \tag{27a}$$
$$\forall m\in\{1,2,...,l_m\}$$

So we can write the algorithm as following:

for each iteration k (28a)

1. $u^{m,(k+1)}=arg\min L^m_p(u^m,z^{(k)},\nu^{m,(k)})=$
$$\sum_{k=1}^{l_t} u^m_{k,m}C_{k,m}+\nu^{m,(k)}*(u^m-z^{(k)})+\frac{\rho}{2}\|u^m-z^{(k)}\|^2$$
subject to:
$$\sum_{k=1}^{l_t} u^m_{k,m}w_k\le c^m$$
$$\sum_{i=1}^{l_e} u^{e,m}_{k,i}+\sum_{j=1}^{l_f} u^{f,m}_{k,j}+\sum_{h=1}^{l_c} u^{c,m}_{k,h}=1 \qquad \forall k\in\{1,2,...,l_t\}$$
$$\sum_{i=1}^{l_e} u^{e,m}_{k,i}\tau^e_{k,i}+\sum_{j=1}^{l_f} u^{f,m}_{k,j}\tau^f_{k,j}+\sum_{h=1}^{l_c} u^{c,m}_{k,h}\tau^c_{k,h}\le\delta_k \qquad \forall k\in\{1,2,...,l_t\}$$
2. $z^{(k+1)}=\bar{u}^{(k+1)}+\frac{1}{\rho}\bar{\nu}^{(k)}$
3. $\nu^{m,(k+1)}=\nu^{m,(k)}+\rho(u^{m,(k+1)}-z^{(k+1)})$

F. Solution 2

lagrangian of main problem is as following

$$L(x^e,x^f,x^c,\lambda,\nu)=\sum_{i=1}^{l_e}\sum_{k=1}^{l_t} x^e_{k,i}C^e_{k,i}+\sum_{j=1}^{l_f}\sum_{k=1}^{l_t} x^f_{k,j}C^f_{k,j}+\sum_{h=1}^{l_c}\sum_{k=1}^{l_t} x^c_{k,h}C \tag{29a}$$
$$+\sum_{k=1}^{l_t}\lambda_k(\sum_{i=1}^{l_e} x^e_{k,i}\tau^e_{k,i}+\sum_{j=1}^{l_f} x^f_{k,j}\tau^f_{k,j}+\sum_{h=1}^{l_c} x^c_{k,h}\tau^c_{k,h}-\delta_k)$$
$$+\sum_{k=1}^{l_t}\nu_k(\sum_{i=1}^{l_e} x^e_{k,i}+\sum_{j=1}^{l_f} x^f_{k,j}+\sum_{h=1}^{l_c} x^c_{k,h}-1)$$

So we can decompose the lagrangian as follows

$$L(x^e,x^f,x^c,\lambda,\nu)= \tag{30a}$$
$$\sum_{i=1}^{l_e}\sum_{k=1}^{l_t}(x^e_{k,i}C^e_{k,i}+\lambda_k x^e_{k,i}\tau^e_{k,i}+\nu_k x^e_{k,i}-\frac{\lambda_k\delta_k+\nu_k}{3l_e})$$
$$+\sum_{j=1}^{l_f}\sum_{k=1}^{l_t}(x^f_{k,j}C^f_{k,j}+\lambda_k x^f_{k,j}\tau^f_{k,j}+\nu_k x^f_{k,j}-\frac{\lambda_k\delta_k+\nu_k}{3l_f})$$
$$+\sum_{h=1}^{l_c}\sum_{k=1}^{l_t}(x^c_{k,h}C^c_{k,h}+\lambda_k x^c_{k,h}\tau^c_{k,h}+\nu_k x^c_{k,h}-\frac{\lambda_k\delta_k+\nu_k}{3l_c})$$

Algorithm 1

while not converged **do**
  1. update x^c, x^f, x^e using (19a)
  2. update lagrangian multipliers using (20a) and (21a)
  $\alpha = \frac{\alpha_0}{k}$ for each iteration k
end while
